**Rope drum horsepower**

The usable rope drum horsepower is the net engine horsepower less frictional losses of the power train. The Link-Belt® LS-106B excavator/crane power train, with its machine cut gears, anti-friction bearings and in-line shaft mountings reduces frictional losses. Thus, more usable engine horsepower is available at the rope drums, maintaining high production standards.

**Angle boompoint**

Sheaves and roller-type hoist rope guards are mounted on anti-friction bearings for increased rope and sheave life.

**Full-revolving fairlead**

Rotates to insure full inhaul rope support in all positions. All moving parts are mounted on anti-friction bearings. Fairlead can be locked in vertical position to permit lowering of boom to ground for routine maintenance.
